*Teaching and Learning in Nursing* Gregor Stiglic 2017-05-17 A significant body of knowledge is the basis for a holistic, caring and scientific evidence-based nursing education in practice for professional development. Quality teaching leads to good learning and both aspects are two of the main issues of quality assurance in nursing education today. To begin with, not all nursing students have the same levels of motivation or learning abilities. It is with cognisance of providing quality care for patients that the role of the nurse educator has to be to enhance nursing students' learning using scientific evidence based teaching. Research around teaching and learning processes is an important part of the delivery of quality education, which in turn impacts on students' learning results and experiences, thereby, ensuring holistic biopsychosocial care to patients. The main aim of teaching and learning in nursing, at all levels, is to enhance the nurses' contribution to assist the individuals, families and communities in promoting and preserving health, well-being and to efficiently respond to illnesses. We hope that this book can be used as a resource to increase the body of knowledge in teaching and learning in nursing, thereby enhancing the role and contribution of health care professionals to clinical practice.

*Improving Documentation of Nursing Students Clinical Skills Via Deliberate Practice* Llynne C Kiernan 2016 "Today's highly demanding healthcare environment requires the effective use of clinical critical thinking and motor skills in complex care situations to achieve optimum patient outcomes. The purpose of the evidence-based practice (EBP) clinical project was to use the simulation laboratory to assess and document sophomore baccalaureate nursing students' competence in clinical skill acquisition. The function of nursing education is to develop knowledgeable nurses capable of providing safe, highly competent, and skilled patient care. The nursing literature supports utilizing the principles of deliberate practice in a simulation laboratory setting with the attendant assessment, feedback and guided repetition that led to improved student performance. Clinical skill acquisition requires nursing students to spend time in the simulation laboratory to practice clinical skills repetitively and receive immediate feedback from faculty. Feedback on student performance is an important aspect of deliberate practice and facilitates the development of clinical practice habits. Comparison of clinical competence using the Clinical Competency Questionnaire tool pre-intervention and post-intervention educational sessions was utilized. A 37.26% increase was noted from pre-intervention educational sessions to post-intervention educational sessions (Pre-test mean: 108.05; Post-test mean: 148.31). In turn, the process provided nursing students with close supervision, guidance and the ability to practice specific skills in the simulation laboratory numerous times through a method of deliberate practice before demonstrating competency and proficiency. The EBP clinical change project suggested that improvement in clinical competence was related to educational sessions, faculty demonstrations of clinical skills, nursing student's demonstration of skills, and documentation of clinical skills on a skills checklist." -- Abstract.
